

SignFlow — Administrator Guide

Running SignFlow for your organisation

The admin console gives you everything needed to run SignFlow. Sign in with an administrator account to see these modules. For the step-by-step rollout (creating teams and users), use the companion **IT Onboarding Playbook**.

The Administrator console — every module in one place.

Users

- Add users individually (3-step wizard) or in **bulk** by department.
- Set each person's role — **Administrator / Requestor / Approver** — and assign a team or signing authority.
- Delete users when needed: their name shows as “—” in past requests, but document history is preserved.

Teams & authority

- Create or remove teams (business functions such as Finance, Operations, IT).
- View and edit who can sign for each team — this controls where requests are routed.

Signatures

- Upload a signature image on behalf of any user.
- **Bulk-upload** signatures by naming each file with the user's email (e.g., `jane@hqhb.in.png`) — SignFlow matches them automatically.

All documents

- See every request across the company, filterable by status (All / Pending / Approved / Rejected).

- Download originals or signed copies for any audit.

Reports

- Team-wise totals — pending, approved, rejected.
- A top-approvers leaderboard.
- Full **CSV export** of the complete request history.

Email log

Audit every notification SignFlow has sent — invitations, approvals, reminders, and password resets — with delivery status.

Helping users with access

- Re-send an invite or reset a password from the **Users** page; a fresh temporary password is generated.
- Users can also self-serve via **Forgot password?** on the login screen.

Most day-to-day admin work is onboarding people. Keep the **IT Onboarding Playbook** handy for the first few weeks.
