

SignFlow — IT Onboarding Playbook

Set up teams, create users, and get everyone signed in

Step 0 — Create your teams first

SignFlow organises people into **teams** (business functions). Create these before adding users: **Admin** → **Teams & authority** → **Add team** (e.g., Finance, Operations, IT, HR, Management).

- **Requestors** are assigned to one team (their department).
- **Approvers** are granted **signing authority** over one or more teams.

The three roles

Role	What they do	Who gets it
Requestor	Submits documents for signature; downloads signed copies	Most staff
Approver	Reviews and signs documents routed to them	Managers, Finance, authorised signatories
Administrator	Full control of users, teams, signatures, reports	IT only

Details to capture from each user

Collect this for every person before creating accounts. It doubles as your bulk-import sheet.

Field	Required?	Notes
Full name	Yes	As it should appear on signatures and records
Work email	Yes	This is their login — must be unique
Role	Yes	Requestor / Approver / Administrator
Department (team)	Yes (Requestors)	Which business function they belong to
Signing authority	Yes (Approvers)	Which team(s) they may sign for
Signature image	Optional	They can register it themselves on first login

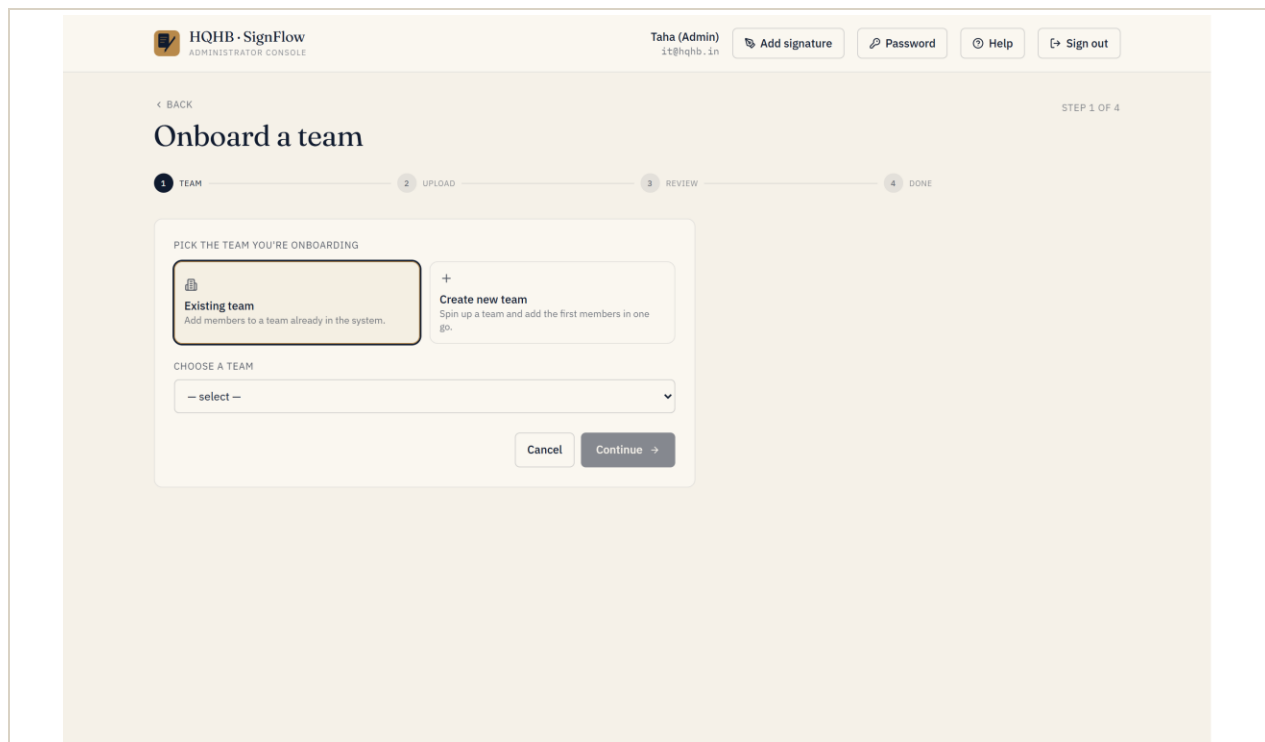

Creating users — two ways

A. By department, in bulk (recommended for rollout)

1. **Admin** → **Onboard team**.
2. Pick or create the team (department).
3. Upload a spreadsheet of members — columns **name**, **email** (optional **role**; defaults to Requestor).
4. Review the parsed rows; adjust each person's role and tick signing authority where needed.
5. Create the accounts — and email everyone their credentials in one click.

Everyone in the upload is auto-assigned to that team, so you don't need team IDs. A CSV you can start from:

```
name,email,role
Jane Doe,jane.doe@hqhb.in,requestor
Moiz Khan,moiz.khan@hqhb.in,approver
```

Onboard team — pick or create a team, then upload the member list.

B. One person at a time

1. **Admin** → **Users** → **Add user**.
2. **Identity** — Full name, Work email, Initial password (at least 6 characters; they change it later).
3. **Role & assignment** — choose the role, then the department (Requestor) or tick signing-authority teams (Approver). Admins need no assignment.
4. **Confirm** → **Create user**.
5. **Share the credentials** — this path does not auto-email; send the user their email and temporary password.

What each user does on first login

1. Go to <https://onesign.devhqhb.online/>
2. Sign in with their email and temporary password.
3. Change their password.
4. Register their signature — draw it or upload an image (one-time).
5. They're ready to submit or sign documents.

Optional — pre-load signatures

Admin → **Signatures** → bulk-upload images named `<email>.png` (or `.jpg`). SignFlow matches each image to the user by email automatically, so they can skip the first-login signature step.

Suggested rollout order

1. Create teams.
2. Add the IT administrator account(s).
3. Onboard each department in bulk — set approvers and signing authority as you go.
4. (Optional) Pre-load signatures.
5. Send the announcement email.

6. Keep it@hqhb.in / taha.chunawala@hqhb.in ready for first-week questions.
